Advanced Inorganic Chemistry: A Comprehensive Text F. Albert Cotton, Geoffrey Wilkinson, Manfred Bochmann, Russell N. Grimes

Incorporates the many new chemical developments, particularly the more recent theoretical advances in the interpretation of bonding and reactivity in inorganic compounds. Provides a reasonable achievement for advanced students, as it encompasses the chemistry of all chemical elements and their compounds, including interpretative discussion in light of the advances in structural chemistry, general valence theory, and ligand field theory. It covers the periodic table systematically, and special chapters treat metal atom clusters, reaction mechanisms, metal carbonyls, and bio-inorganic chemistry. Since the Fourth Edition, descriptive chemistry has been increased and theoretical material decreased where necessary.
